

Evidence map and manuscript navigation

A reading map of the manuscript — what each layer is, what it supports, and what it cannot prove. Not a new result.

OBSERVATION FRAMEWORK · Figure 2 — read this first (a reading rule, not a data layer)

NET burden is a stock-like observable: a single scalar burden does not identify formation vs removal (stock ≠ flow).
Measurement breakers define the data future studies must collect to make a mechanism identifiable.

F2

Independent public layers · honest synthesis · no sample-level fusion

LAYER · DATASET · EVIDENCE TYPE	SUPPORTS (can say)	CANNOT PROVE	SEE
Rapid signaling PXD029046 · human article-level evidence seconds–minutes	rapid signaling context (published)	<i>reusable phosphosite table</i> <i>downstream function</i>	F7
MEASURED RESULT Metabolic state Li_ST002477 · human neutrophil metabolomics COVID-19 severity · minutes–hours	measured metabolic-state separation (Control/Mild/Severe; p≈0.001)	<i>metabolic flux</i> <i>causality</i> <i>biomarker validation</i>	F3–4
Released material + PTM Chapman_PXD011796 · human RA/SLE NET/release composition + PTM entries effector output	structured released material; 752 proteins · histone H3 across PTM entries	<i>NETosis rate</i> <i>enzyme activity</i> <i>pathogenicity</i>	F5
Cell-state architecture NeuMap · primarily mouse-derived reported human conservation 3039 markers · 7 hubs	reference state architecture (interpretive scaffold)	<i>co-measured human layer</i> <i>functional validation</i> <i>cross-layer coupling</i>	F6
Four-layer model conceptual synthesis hypothesis-generating	why paired temporal perturbational data are needed	<i>cross-layer coupling proven</i> <i>causal mechanism</i>	F7

Evidence strength: measured quantitative result › structured compositional evidence › reference architecture › article-level evidence

Claim ceiling: each source supports only the inference allowed by its evidence type

Measured result: metabolic layer only. Other layers: compositional, reference or article-level evidence.

Figure 1 · navigation map, not a new result · no sample-level fusion, no causal coupling, no biomarker validity, no therapeutic targetability.
