

A separable metabolic state across COVID-19 severity

Human neutrophil metabolome (Li_ST002477) · 287 metabolites × 75 samples · Control 19 / Mild 30 / Severe 26

a · Severity groups occupy distinguishable metabolic states

b · Distributional separation is significant and severity-ordered

Bar lengths summarize the observed ordering of MMD and energy-distance results; they are not a new metric. Permutation-based $p \approx 0.001$ for all pairwise comparisons.

Figure 3 · measured result = the distributional separation · no flux, no causal claim, no clinical prediction
