

NeuMap reference architecture for neutrophil state interpretation

A reference state architecture — not a co-measured human layer, not functional validation

a · NeuMap as reference state architecture

3039

marker genes

7

hubs (state programs)

- primarily mouse-derived neutrophil state architecture
- reported human conservation

**reference architecture,
not a co-measured human layer**

b · State-architecture logic (7 hubs)

state organization, not direct functional validation

7 conserved state programs (e.g. maturation, IFN-response, immunosuppressive, antigen-presentation)

c · How NeuMap is used in this manuscript

- a reference frame for neutrophil state
- a state vocabulary for interpretation
- an architecture for reading the other layers
- a bridge to future paired human-neutrophil studies

interpretive scaffold, not integrated co-measurement

d · Interpretive boundary

✓ mouse-derived reference · reported human conservation

not co-measured here

not a causal mechanism

not proof of cross-layer coupling

not a clinical biomarker

not executed function
