

In silico measurement-design identifiability map

Which measurement breaker reduces which ambiguity that burden-only readouts collapse, under known latent truth

ambiguity-reduction score: 0 = indistinguishable from burden alone, 1 = resolved

- Burden-only (M0) resolves nothing — confirms the central point.
- Different breakers resolve different ambiguities; formation does not resolve detectability (A2, M1=0).
- Blind spots: viability (A4) and functional execution (A5) are unresolved unless measured directly (M4, M5).
- Even the combined panel (M7) misses A4 — no single design resolves the full latent space.
- Failure mode: the time-course breaker (M3) degrades under high observation noise (score 1.00 to ~0.8).
